

- a computer has software that supports components such as memory, sound card, and video card. Also a computer has only one operating system installed.
- a computer can be sold with one accessory: keyboard, monitor, or mouse.
- a computer can be either laptop, or desktop.
- If you have a desktop computer you can manage its components such as memory, sound card, and video card. On the other hand, if you have a laptop, you can manage its memory only.
